

Summary of the dataset and the machine learning problem

The selected dataset is for spam emails, so the machine learning problem is a classification problem. The dataset includes multiple columns to help determine whether an email is spam or not, such as frequently used words and characters. The target variable is the class column, which will have a value of either 0 or 1. If the email is not spam it will be represented by 0, and if it is spam it will be represented by 1. The model is expected to learn from the different features of the emails to predict whether a new email is spam or not.
